### **Advice on Team Project 2**

#### Some Advice on Assignment 11

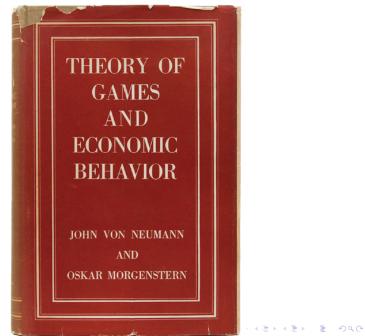

On Problem 10.4-1:

- No Expected Values Here
- Want Probability he ends up with exactly 100 dollars
- Decision variable  $x_n$  = amount to bet on *n*th match
- States to consider: s<sub>n</sub> = current fortune of the player before betting on the *n*th match.
- Interesting values of s to consider (perhaps): 0 ≤ s < 25, 25, 25 < s < 50, 50, 50 < s < 75, 75, 75 < s < 100, 100, s > 100
- The only probabilities you should see are 0, 1/4, 1/2, 3/4 and 1.
- ▶ Worth looking carefully at solution to 10.4-2.
- ► It may be useful to look at a recursive relation of the form  $f_n(s_n, x_n) = \frac{1}{2}f_{n+1}^*(s_n x_n) + \frac{1}{2}f_{n+1}^*(s_n + x_n)$

"Best of Worst" Maximin and Minimax **Strategies** Lower Value and Upper Value Saddle Points

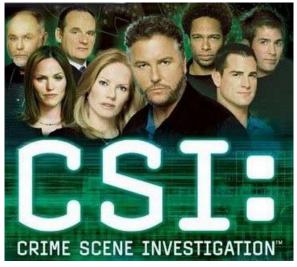

Two television networks believe there are 100 million potential viewers for Thursday night, prime-time (8 - 9 PM).

The networks must decide which type of program to broadcast: Science Fiction (*Vermont Vampires*), Drama(*CSI Middlebury*), or Comedy (*Old Chapel's Big Bang Theory*).

If the two networks initially split the 100 million viewers evenly, think of the payoff matrix entries as how many excess viewers the network's strategies will yield over 50 million.

#### **Vermont Vampires**

**CSI** Middlebury

#### **Old Chapel's Big Bang Theory**

メロト メロト メヨト メヨト

э

A football play (in which the scores does not change) is an example of a zero-sum game when the payoff is measured by yards gained or lost. In a football game, there are two players: Offense and Defense.

For simplicity, suppose the Offense has two strategies: Pass or Run while the Defense has three strategies: Pass Defense, Run Defense, or Blitz.

	Pass	Run		Row's	
	Defense	Defense	Blitz	Worst	
Pass	-3	9	-5	-5	
Run	4	-3	6	-3	$\Leftarrow$

## An Historical Example

## World War II Click for More Information: Operation Lüttich and Operation Tractable, August 1944

Omar Bardley

Günther Von Kluge

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─ 臣

Example: In August 1944 after the invasion of Normandy, the Allies broke out of their beachhead at Avranches, France and headed into the main part of the country. The German General von Kluge, commander of the ninth army, faced two options:

- $T_1$ : Stay and attack the advancing Allied armies.
- T<sub>2</sub>: Withdraw into the mainland and regroup.

Simultaneously, General Bradley, commander of the Allied ground forces faced a similar set of options regarding the German ninth army:

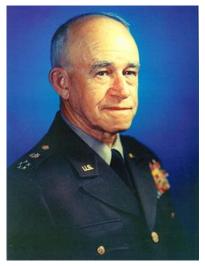

- S<sub>1</sub> Reinforce the gap created by troop movements at Avranches
- $S_2$  Send his forces east to cut-off a German retreat
- >  $S_3$  Do nothing and wait a day to see what the adversary did.

In real life, there were no pay-off values, however General Bradley's diary indicates the scenarios he preferred in order. There are six possible scenarios. Bradley ordered them from most to least preferable and using this ranking, we can construct the game matrix.

	Von Kluge's	Strategies	Row Min	
Bradley's Strategies	Attack	Retreat		
Reinforce Gap	2	3	2	
Move East	1	5	1	
Wait	6	4	4	$\Leftarrow \underline{v}$
Column Max	6	5		
		$\uparrow ar{m{ u}}$		

Notice that the maximin value of the rows is not equal to the minimax value of the columns. This is indicative of the fact that there is not a pair of strategies that form an equilibrium for this game.

Omar Bardley

Günther Von Kluge

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─ 臣

	Von Kluge's	Strategies	Row Min	
Bradley's Strategies	Attack	Retreat		
Reinforce Gap	2	3	2	
Move East	1	5	1	
Wait	6	4	4	$\leftarrow \underline{v}$
Column Max	6	5		
		↑ <b>⊽</b>		'

Suppose that von Kluge plays his minimax strategy to retreat then Bradley would do better not to play his maximin strategy (wait) and instead move east, cutting of von Kluge's retreat, thus obtaining a payoff of (5, -5). But von Kluge would realize this and deduce that he should attack, which would yield a payoff of (1, -1). However, Bradley could deduce this as well and would know to play his maximin strategy (wait), which yields payoff (6, -6). However, von Kluge would realize that this would occur in which case he would decide to retreat yielding a payoff of (4, -4). The cycle then repeats.

## A Simpler Example

	$T_1$	$T_2$	Worst
$S_1$	8	-3	-3
$S_2$	-5	4	-5
Worst	8	4	

Here  $\underline{v} = -3$  and  $\overline{v} = 4$ . **Rose** can guarantee herself -3 by playing  $S_1$ . **Colin** can limit her winnings to 4. **Rose** tentatively selects  $S_1$  and **Colin** selects  $T_2$ . But if **Rose** knows **Colin** will play  $T_2$ , she should switch to  $S_2$ . Knowing this, **Colin** switches to  $T_1$  but.. Then **Rose** switches to  $S_1$  causing **Colin** to... How Should Each Play The Game? Choose a Strategy At Random! But With What Probability?

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Mixed Strategies  
Let 
$$p$$
 be the probability Rose plays  $S_1$ .  
The  $1 - p$  is the probability she plays  $S_2$ .  
Similarly,  $q$  and  $1 - q$  would represent the probabilities that Colin  
selects  $T_1$  and  $T_2$ , respectively.  
Then the probabilities of the various outcomes are given by  

$$\frac{q}{p} \frac{1-q}{p} \frac{p(1-q)}{(1-p)(1-q)}$$
with payoffs  

$$\frac{q}{1-p} \frac{1-q}{p} \frac{1-q}{8}$$

$$\frac{q}{1-p} \frac{1-q}{-5} \frac{1-q}{4}$$

Expected Value for Rose =

 $\mathbf{EV} = 8pq - 3p(1-q) + (-5)(1-p)q + 4(1-p)(1-q)$ 

## Expected Value for Rose =EV = 8pq - 3p(1-q) + (-5)(1-p)q + 4(1-p)(1-q)= 20pq - 7p - 9q + 4 $=(4p-\frac{9}{5})(5q-\frac{7}{7})-\frac{63}{7}+4$ $=(4p-\frac{9}{5})(5q-\frac{7}{4})+\frac{17}{20}$ **Rose:** $4p = \frac{9}{5} \Rightarrow p = \frac{9}{20}$ **Colin:** $5q - \frac{7}{4} \Rightarrow q = \frac{7}{20}$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

	$T_1$	$T_2$	Worst
$S_1$	8	-3	-3
$S_2$	-5	4	-5
Worst	8	4	

Here  $\underline{v} = -3$  and  $\overline{v} = 4$ .

$$EV = (4p - \frac{9}{5})(5q - \frac{7}{4}) + \frac{17}{20}$$
  
With  $p = \frac{9}{20}$  and  $q = \frac{7}{20}$ ,  
the Expected Value of the Game is  $\frac{17}{20}$ 

<□▶ <□▶ < □▶ < □▶ < □▶ < □▶ = のへぐ

 $EV_{Rose} = 20pq - 7p - 9q + 4$ = (20q - 7)p - 9q + 4So **Colin** should choose  $q = \frac{7}{20}$  $EV_{Colin} = -(20pq - 7p - 9q + 4)$ = -20pq + 7p + 9q - 4 =(9-20p)q+7p-4So **Rose** should choose  $p = \frac{9}{20}$
