# Dynamic Programming

Dynamic programming is a useful technique that we can use to solve many optimization problems by breaking up large problems into a sequence of smaller, more tractable problems and then **working backward** from the end of the problem toward the beginning of the problem.

# Characteristics of Dynamic Programming Problems

## Characteristics of Dynamic Programming Problems II

Problem can be divided into stages with a policy decision required at each stage.

- ▶ Each stage has a number of states associated with the beginning of the stage.
- ▶ The effect of the policy decision at each stage is to transform the current state to a state associated with the beginning of the next stage.
- ▶ The solution procedure finds an optimal policy for the overall problem.
- ▶ *The Principle of Optimality*: An optimal policy for the remaining stages is independent of the policy decisions adopted at previous stages.
- ▶ Solution procedure begins by finding optimal policy for the last stage.
- ▶ A recursive relationship that identifies the optimal policy for stage  $n$  given the optimal policy for  $n+1$  is known.

$$f_n^*(s) = \min[C_{sx_n} + f_{n+1}^*(x_n)]$$

- ▶ A recursive relationship that identifies the optimal policy for stage  $n$  given the optimal policy for  $n+1$  is known.

$$f_n^*(s) = \min[C_{sx_n} + f_{n+1}^*(x_n)]$$

$N$  = number of stages

$n$  = label for current stage ( $n = 1, 2, \dots, N$ )

$s_n$  = current state for stage  $n$

$x_n$  = decision variable for stage  $n$

$x_n^*$  = optimal value for  $x_n$  given  $s_n$

$f_n(s_n, x_n)$  = contribution of stages  $n, n + 1, \dots, N$  to objective function if the system starts in state  $s_n$  at stage  $n$ , we make decision  $x_n$  and we make optimal decisions at all future stages.

- ▶ Use the recursive relationship to work backward stage by stage.

Construct a table at each stage:

# Stages With Infinitely Many States

# Continuous State Variables

Maximize

$$g(x, y) = 8x - 2x^2 + 144y - 3y^3$$

subject to

$$x + y \leq 7$$

$$x, y \geq 0$$

## Solution via Dynamic Programming

*Stages:* Stage 1 = Choose  $x$ , Stage 2 = Choose  $y$

Let  $R$  = amount of slack left in constraint  $x + y \leq 7$

$$g(x, y) = 8x - 2x^2 + 144y - 3y^3$$

$$\text{Then } f_2^*(R) = \max_{0 \leq y \leq R} (144y - 3y^3)$$

$$f_2^*(R) = \max_{0 \leq y \leq R} (144y - 3y^3)$$

Now  $f_2(R, y) = 144y - 3y^3$

so  $\frac{\partial f_2}{\partial y} = 144 - 9y^2$

which equals 0 when  $y = 4$ .

Thus

$$y^* = \begin{cases} R & \text{if } 0 \leq R \leq 4 \\ 4 & \text{if } 4 \leq R \leq 7 \end{cases}$$

$$f_2^*(R) = \max_{0 \leq y \leq R} (144y - 3y^3)$$

$$y^* = \begin{cases} R & \text{if } 0 \leq R \leq 4 \\ 4 & \text{if } 4 \leq R \leq 7 \end{cases}$$

Note  $f_2(R, 4) = 144(4) - 3(4^3) = 576 - 192 = 384$

**n = 2**

$R$	$f_2^*(R)$	$y^*$
$0 \leq R \leq 4$	$144R - 3R^3$	$R$
$4 \leq R \leq 7$	384	4

$$\begin{aligned} f_1^*(7) &= \max_{0 \leq x \leq 7} (-2x^2 + 8x + f_2^*(7-x)) \\ &= \max \begin{cases} \max_{0 \leq x \leq 3} (-2x^2 + 8x + 384) \\ \max_{3 \leq x \leq 7} (-2x^2 + 8x + 144(7-x) - 3(7-x)^3) \end{cases} \end{aligned}$$

For  $0 \leq x \leq 3$

$$f_1(7, x) = -2x^2 + 8x + 384$$

$$\text{Here } \frac{\partial f_1(7, x)}{\partial x} = -4x + 8 \text{ which is 0 at } x = 2$$

$$\text{with maximum value } f_1(7, 2) = -2(2^2) + 8(2) + 384 = 392$$

For  $3 \leq x \leq 7$

$$f_1(7, x) = -2x^2 + 8x + 144(7 - x) - 3(7 - x)^3$$

$$\begin{aligned} \text{Here } \frac{\partial f_1(7, x)}{\partial x} &= -4x + 8 - 144 + 9(7 - x)^2 \\ &= -4x - 136 + 9(7 - x)^2 \end{aligned}$$

The second derivative is  $-4 - 18(7 - x)$  which is negative so  $f_1(7, x)$  will have a maximum value when its first derivative is 0.

$$9(7 - x)^2 = 4x + 136$$

$$9(49 - 14x + x^2) - 4x - 136 = 0$$

$$9x^2 - 126x + 441 - 4x - 136 = 0$$

$$9x^2 - 130x + 305 = 0$$

Quadratic formula yields

$$x = \frac{130 \pm \sqrt{(-130)^2 - 36(305)}}{18}$$

$$\text{or } x = \frac{65 \pm 2\sqrt{370}}{9}$$

Roots are approximately 11.5 and 2.95, neither of which is in the interval  $[3, 7]$ .

Thus the maximum occurs at an end point.

$$\text{Recall } \frac{\partial f_1(7, x)}{\partial x} = -4x + 8 - 144 + 9(7 - x)^2$$

$$\text{So at } x = 3 : -4(3) - 136 + 9 \times 4^2 = -12 - 136 + 144 < 0$$

$$\text{and at } x = 7 : -4(7) - 136 + 9(0^2) = -28 - 136 < 0$$

Thus  $f_1(7, x)$  is decreasing at both endpoints.

The maximum occurs at  $x = 3$ .

Graph of  $f_1(7, x)$

$$f_1(7, 3) = -2(3^2) + 8(3) + 144(4) - 3(4^3) = 390$$

Thus  $f_1^*(7) = \max(392, 390) = 392$  so  $x_1^* = 2$ .

Finally, with  $x_1^* = 2$ ,  $R = 7 - 2 = 5$  so  $y^* = 4$ .

The maximum value of the objective function is

$$g(x, y) = g(2, 4) = 8(2) - 2(2^2) + 144(4) - 3(4^3) = 392.$$

# Probabilistic Dynamic Programming I

Henry Brewster decides to market the Fancy Assortment through three local outlets: Shaw's, Hannaford, and the Middlebury Co-Op.

Each day he produces 6 cases (24 boxes each) at a cost to him of \$100 a case. Each case sold at an outlet yields \$200.

Any unsold assortments are returned to the factory where he can sell them at \$50 a case as stale products the next day.

*Probability Distribution for Daily Demand*  
(demand in cases)

		1	2	3
Store 1	Shaw's	.6	0	.4
Store 2	Hannaford's	.5	.1	.4
Store 3	Middlebury Co-Op	.4	.3	.3

**Problem:** How should he allocate the 6 cases to the three outlets to maximize his expected revenue?

*Observations*

- ▶ Don't give more than 3 cases to any store
- ▶ Distribute all 6

Expected Revenue Earned from Allocating  $x_n$  cases to store n  
(in hundreds of dollars)

$x_n$	Store 1 Shaw's	Store 2 Hannaford's	Store 3 Co-Op
<b>0</b>	<b>\$0</b>	<b>\$0</b>	<b>\$0</b>
<b>1</b>	<b>\$2</b>	<b>\$2</b>	<b>\$2</b>
<b>2</b>	<b>\$3.10</b>	<b>\$3.25</b>	<b>\$3.40</b>
<b>3</b>	<b>\$4.20</b>	<b>\$4.35</b>	<b>\$4.35</b>

Allocate 2 to Shaw's (Store 1)  
 $.6 (\text{Sell 1, Return 1}) + .4 (\text{Sell 2})$   
 $.6(2 + 1/2) + .4(4) = 1.5 + 1.6 = 3.1$

Allocate 3 to Shaw's  
 $.6 (\text{Sell 1, return 2}) + .4 (\text{sell 3})$   
 $.6(2 + 1) + .4(6) = 1.8 + 2.4 = 4.2$

Allocate 2 to Hannaford's (Store 2)

$$\begin{aligned} &.5 (\text{Sell 1, return 1}) + .5(\text{sell 2}) \\ &.5(2 + 1/2) + .5(4) = 3.25 \end{aligned}$$

Allocate 3 to Hannaford's

$$\begin{aligned} &.5(\text{sell 1, return 2}) + .1(\text{sell 2, return 1}) + .4(\text{sell 3}) \\ &.5(2 + 1) + .1(4 + 1/2) + .4(6) \\ &1.5 + .45 + 2.4 = 4.35 \end{aligned}$$

Allocate 2 to Co-Op

$$\begin{aligned} &.4(\text{sell 1, return 1}) + .6(\text{sell 2}) \\ &.4(2 + 1/2) + .6(4) = 1 + 2.4 = 3.4 \end{aligned}$$

Allocate 3 to Co-Op

$$\begin{aligned} &.4(\text{sell 1, return 2}) + .3(\text{sell 2, return 1}) + .3(\text{sell 3}) \\ &.4(2 + 1) + .3(4 + ?) + .3(6) = 1.2 + 1.35 + 1.8 = 4.35 \end{aligned}$$

Expected Revenue Earned from Allocating  $x_n$  cases to store  $n$   
(in hundreds of dollars)

$x_n$	Store 1 Shaw's	Store 2 Hannaford's	Store 3 Co-Op
<b>0</b>	<b>\$0</b>	<b>\$0</b>	<b>\$0</b>
<b>1</b>	<b>\$2</b>	<b>\$2</b>	<b>\$2</b>
<b>2</b>	<b>\$3.10</b>	<b>\$3.25</b>	<b>\$3.40</b>
<b>3</b>	<b>\$4.20</b>	<b>\$4.35</b>	<b>\$4.35</b>

Let  $r_i(s)$  = expected revenue of giving  $s$  cases to store  $i$ .  
Then the recursive relationship is

$$f_3(s) = r_3(s)$$

$$f_n(s) = r_n(s) + f_{n+1}^*(s - s)$$

$$f_n^*(s) = \max_{k \leq s} [r_n(k) + f_{n+1}^*(s - k)]$$

$$f_3(s) = r_3(s)$$

$n = 3$	Co-Op					
$x_3$	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	$f_3^*$	$x_3^*$
$s$						
<b>0</b>	<b>0</b>	–	–	–	<b>0</b>	<b>0</b>

4	—	$2 + 4.35 = 6.35$	$3.25 + 3.4 = 6.65$	$4.35 + 2 = 6.35$	6.65	2	
5	—	—	$3.25 + 4.35 = 7.60$	$4.35 + 3.4 = 7.75$	7.75	3	
6	—	—	—	$4.35 + 4.35 = 8.70$	8.70	3	

$$f_1^*(s) = \max_{k \leq s} [r_1(k) + f_2^*(s - k)]$$

$n = 1$	Shaw's					
$x_1$	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	$f_1^*$	$x_1^*$
$s$						
<b>6</b>	<b>0 + 8.70 = 8.70</b>	<b>2 + 7.75 = 9.75</b>	<b>3.10 +6.65 = 9.75</b>	<b>4.2 + 5.40 = 9.60</b>	<b>9.75</b>	<b>1 or 2</b>

## *Solutions*

Store	Number of Cases	Number of Cases
Shaw's	1	2
Hannaford	3	2
Co-Op	2	2

**Expected Value of  
Revenue: \$975**

## Expected Value of Revenue: \$975

**Best Possible Outcome**

**Sell all 6 cases → \$1200**

**Worst Possible Outcome**

**Sell 1 at each store**

**3 sales, 3 returns**

**Revenue =  $3 \cdot \$200 + 3 \cdot \$50 = \$750$**
